The most up-to-date Argus Coal Daily methodology is available on www.argusmedia.com
Methodology overview

Methodology rationale
Argus strives to construct methodologies that reflect the way the market trades. Argus aims to produce price assessments which are reliable indicators of commodity market values, free from distortion and representative of market values. As a result, the specific currencies, volume units, locations and other particulars of an assessment are determined by industry conventions.

In the coal markets, Argus publishes weekly physical and daily over-the-counter market prices in the open market as laid out in the specifications and methodology guide. Argus uses the trading period deemed by Argus to be most appropriate, in consultation with industry, to capture market liquidity.

In order to be included in the assessment process, deals must meet the minimum volume, delivery, timing and specification requirements in our methodology. In illiquid markets, and in other cases where deemed appropriate, Argus assesses the range within which product could have traded by applying a strict process outlined later in this methodology.

Survey process
Argus price assessments are informed by information received from a wide cross section of market participants, including producers, consumers and intermediaries. Argus reporters engage with the industry by proactively polling participants for market data. Argus will contact and accept market data from all credible market sources including front and back office of market participants and brokers. Argus will also receive market data from electronic trading platforms and directly from the back offices of market participants. Argus will accept market data by telephone, instant messenger, email or other means.

Argus encourages all sources of market data to submit all market data to which they are a party that falls within the Argus stated methodological criteria for the relevant assessment. Argus encourages all sources of market data to submit transactional data to back office functions.

Throughout all markets, Argus is constantly seeking to increase the number of companies willing to provide market data. Reporters are mentored and held accountable for expanding their pool of contacts. The number of entities providing market data can vary significantly from day to day based on market conditions.

For certain price assessments identified by local management, if more than 50% of the market data involved in arriving at a price assessment is sourced from a single party the supervising editor will engage in an analysis of the market data with the primary reporter to ensure that the quality and integrity of the assessment has not been affected.

Market data usage
In each market, Argus uses the methodological approach deemed to be the most reliable and representative for that market. Argus will utilise various types of market data in its methodologies, to include:

- Transactions
- Bids and offers
- Other market information, to include spread values between grades, locations, timings, and many other data.

In many markets, the relevant methodology will assign a relatively higher importance to transactions over bids and offers, and a relatively higher importance to bids and offers over other market information. Certain markets however will exist for which such a hierarchy would produce unreliable and non-representative price assessments, and so the methodology must assign a different relative importance in order to ensure the quality and integrity of the price assessment. And even in markets for which the hierarchy normally applies, certain market situations will at times emerge for which the strict hierarchy would produce non-representative prices, requiring Argus to adapt in order to publish representative prices.

Verification of transaction data
Reporters carefully analyse all data submitted to the price assessment process. These data include transactions, bids, offers, volumes, counterparties, specifications and any other information that contributes materially to the determination of price. This high level of care described applies regardless of the methodology employed. Specific to transactions, bids, and offers, reporters seek to verify the price, the volume, the specifications, and location basis. The deals are also published in the daily report.

Several tests are applied by reporters in all markets to transactional data to determine if it should be subjected to further scrutiny. If a transaction has been identified as failing such a test, it will receive further scrutiny. For assessments used to settle derivatives and for many other assessments, Argus has established internal procedures that involve escalation of inquiry within the source’s company and escalating review within Argus management. Should this process determine that a transaction should be excluded from the price assessment process, the supervising editor will initiate approval and, if necessary, documentation procedures.

Primary tests applied by reporters
- Transactions not transacted at arm’s length, including deals between related parties or affiliates.
- Transaction prices that deviate significantly from the mean of all transactions submitted for that day.
- Transaction prices that fall outside of the generally observed lows and highs that operated throughout the trading day.
- Transactions that are suspected to be a leg of another transaction or in some way contingent on an unknown transaction.
- Single deal volumes that significantly exceed the typical transaction volume for that market.
- Transaction details that are identified by other market participants as being for any reason potentially anomalous and perceived by Argus to be as such.
• Transaction details that are reported by one counterparty differently than the other counterparty.
• Any transaction details that appear to the reporter to be illogical or to stray from the norms of trading behaviour. This could include but is not limited to divergent specifications, unusual delivery location and counterparties not typically seen.
• Transactions that involve the same counterparties, the same price and delivery dates are checked to see that they are separate deals and not one deal duplicated in Argus records.

Secondary tests applied by editors for transactions identified for further scrutiny

Transaction tests
• The impact of linkage of the deal to possible other transactions such as contingent legs, exchanges, options, swaps, or other derivative instruments. This will include a review of transactions in markets that the reporter may not be covering.
• The nature of disagreement between counterparties on transactional details.
• The possibility that a deal is directly linked to an offsetting transaction that is not publicly known, for example a “wash trade” which has the purpose of influencing the published price.
• The impact of non-market factors on price or volume, including distressed delivery, credit issues, scheduling issues, demurrage, or containment.

Source tests
• The credibility of the explanation provided for the outlying nature of the transaction.
• The track record of the source. Sources will be deemed more credible if they
  • Regularly provide transaction data with few errors.
  • Provide data by Argus’ established deadline.
  • Quickly respond to queries from Argus reporters.
  • Have staff designated to respond to such queries.
  • How close the information receipt is to the deadline for information, and the impact of that proximity on the confirmation process.

Assessment guidelines
When insufficient, inadequate, or no transaction information exists, or when Argus concludes that a transaction based methodology will not produce representative prices, Argus reporters will make an assessment of market value by applying intelligent judgment based on a broad array of factual market information. Reporters must use a high degree of care in gathering and confirming all market data used in determining price assessments, a degree of care equal to that applying to gathering and confirming transactions. The information used to form an assessment could include deals done, bids, offers, tenders, spread trades, exchange trades, fundamental supply and demand information and other inputs.

The assessment process employing judgment is rigorous, replicable, and uses widely accepted valuation metrics. These valuation metrics mirror the process used by physical commodity traders to internally assess value prior to entering the market with a bid or offer. Applying these valuation metrics along with sound judgment significantly narrows the band within which a commodity can be assessed, and greatly increases the accuracy and consistency of the price series. The application of judgment is conducted jointly with the supervising editor, in order to be sure that guidelines below are being followed. Valuation metrics include the following:

Relative value transactions
Frequently transactions occur which instead of being an outright purchase or sale of a single commodity, are instead exchanges of commodities. Such transactions allow reporters to value less liquid markets against more liquid ones and establish a strong basis for the exercise of judgment.

• Exchange one commodity for a different commodity in the same market at a negotiated value.
• Exchange delivery dates for the same commodity at a negotiated value.
• Exchange a commodity in one location for the same commodity at another location at a negotiated value.

Bids and offers
If a sufficient number of bids and offers populate the market, then in most cases the highest bid and the lowest offer can be assumed to define the boundaries between which a deal could be transacted.

Comparative metrics
The relative values between compared commodities are readily discussed in the market and can be discovered through dialogue with market participants. These discussions are the precursor to negotiation and conclusion of transactions.

• Comparison to the same commodity in another market centre.
• Comparison to a more actively traded but slightly different specification commodity in the same market centre.
• Comparison to the same commodity traded for a different delivery timing.
• Comparison to the commodity’s primary feedstock or primary derived product(s).
• Comparison to trade in the same commodity but in a different modality (as in barge versus oceangoing vessel) or in a different total volume (as in full cargo load versus partial cargo load).

Volume minimums and transaction data thresholds
Argus typically does not establish thresholds strictly on the basis of a count of transactions, as this could lead to unreliable and non-representative assessments and because of the varying transport infrastructure found in all commodity markets. Instead, minimum volumes are typically established which may apply to each transaction accepted, to the aggregate of transactions, to transactions which set a low or high assessment or to other volumetrically relevant parameters.

Argus will seek to establish minimum transaction data thresholds and when no such threshold can be established Argus will explain...
the reasons. These thresholds will often reflect the minimum volumes necessary to produce a transaction-based methodology, but may also establish minimum deal parameters for use by a methodology that is based primarily on judgment.

Should no transaction threshold exist, or should submitted data fall below this methodology’s stated transaction data threshold for any reason, Argus will follow the procedures outlined elsewhere in this document regarding the exercise of judgment in the price assessment process.

Transparency
Argus values transparency in energy markets. As a result, where available, we publish lists of deals in our reports that include price, basis, counterparty and volume information. The deal tables allow subscribers to cross check and verify the deals against the prices. Argus feels transparency and openness is vital to developing confidence in the price assessment process.

Swaps and forwards markets
Argus publishes forward assessments for numerous markets. These include forward market contracts that can allow physical delivery and swaps contracts that swap a fixed price for the average of a floating published price. Argus looks at forward swaps to inform physical assessments but places primary emphasis on the physical markets.

Publications and price data
Argus coal prices are published in the Argus Coal Daily report. Subsets of these prices appear in other Argus market reports and newsletters, and form the Argus contribution to indexes published jointly with other independent publishing companies such as the Argus/McCloskey’s Coal Price Index Report and the Argus/Coalindo Indonesian Coal Index Report. The price data are available independent of the text-based report in electronic files that can feed into various databases. These price data are also supplied through various third-party data integrators. The Argus website also provides access to prices, reports and news with various web-based tools. All Argus prices are kept in a historical database and available for purchase. Contact your local Argus office for information.

A publication schedule is available at www.argusmedia.com

Corrections to assessments
Argus will on occasion publish corrections to price assessments after the publication date. We will correct errors that arise from clerical mistakes, calculation errors, or a misapplication of our stated methodology. Argus will not retroactively assess markets based on new information learned after the assessments are published. We make our best effort to assess markets based on the information we gather during the trading day assessed.

Argus reviews corrections for material effect on price data and the amount of time that has elapsed from the date of published price data before deciding whether to issue a correction. After 30 days, Argus is unlikely to make a correction to published data. Argus will not retroactively assess markets based on information learned after the assessments are published.

Ethics and compliance
Argus operates according to the best practices in the publishing field, and maintains thorough compliance procedures throughout the firm. We want to be seen as a preferred provider by our subscribers, who are held to equally high standards, while at the same time maintaining our editorial integrity and independence. Argus has a strict ethics policy that applies to all staff. The policy can be found on our website at www.argusmedia.com. Included in this policy are restrictions against staff trading in any energy commodity or energy related stocks, and guidelines for accepting gifts. Argus also has strict policies regarding central archiving of email and instant messenger communication, maintenance and archiving of notes, and archiving of spreadsheets and deal lists used in the price assessment process. Argus publishes prices that report and reflect prevailing levels for open-market arms length transactions (please see the Argus Global Compliance Policy for a detailed definition of arms length).

Consistency in the assessment process
Argus recognises the need to have judgment consistently applied by reporters covering separate markets, and by reporters replacing existing reporters in the assessment process. In order to ensure this consistency, Argus has developed a programme of training and oversight of reporters. This programme includes:

- A global price reporting manual describing among other things the guidelines for the exercise of judgment
- Cross-training of staff between markets to ensure proper holiday and sick leave backup. Editors that float between markets to monitor staff application of best practices
- Experienced editors overseeing reporting teams are involved in daily mentoring and assisting in the application of judgment for illiquid markets
- Editors are required to sign-off on all price assessments each day, thus ensuring the consistent application of judgment.

Review of methodology
The overriding objective of any methodology is to produce price assessments which are reliable indicators of commodity market values, free from distortion and representative of market values. As a result, Argus editors and reporters are regularly examining our methodologies and are in regular dialogue with the industry in order to ensure that the methodologies are representative of the market being assessed. This process is integral with reporting on a given
market. In addition to this ongoing review of methodology, Argus conducts reviews of all of its methodologies and methodology documents on at least an annual basis.

Argus market report editors and management will periodically and as merited initiate reviews of market coverage based on a qualitative analysis that includes measurements of liquidity, visibility of market data, consistency of market data, quality of market data and industry usage of the assessments. Report editors will review:

- Appropriateness of the methodology of existing assessments
- Termination of existing assessments
- Initiation of new assessments.

The report editor will initiate an informal process to examine viability. This process includes:

- Informal discussions with market participants
- Informal discussions with other stakeholders
- Internal review of market data

Should changes, terminations, or initiations be merited, the report editor will submit an internal proposal to management for review and approval. Should changes or terminations of existing assessments be approved, then formal procedures for external consultation are begun.

Changes to methodology

Formal proposals to change methodologies typically emerge out of the ongoing process of internal and external review of the methodologies. Formal procedures for external consultation regarding material changes to existing methodologies will be initiated with an announcement of the proposed change published in the relevant Argus report. This announcement will include:

- Details on the proposed change and the rationale
- Method for submitting comments with a deadline for submissions
- Notice that all formal comments will be published after the given consultation period unless submitter requests confidentiality.

Argus will provide sufficient opportunity for stakeholders to analyse and comment on changes, but will not allow the time needed to follow these procedures to create a situation wherein unrepresentative or false prices are published, markets are disrupted, or market participants are put at unnecessary risk. Argus will engage with industry throughout this process in order to gain acceptance of proposed changes to methodology. Argus cannot however guarantee universal acceptance and will act for the good order of the market and ensure the continued integrity of its price assessments as an overriding objective.

Following the consultation period, Argus management will commence an internal review and decide on the methodology change. This will be followed by an announcement of the decision, which will be published in the relevant Argus report and include a date for implementation. For prices used in derivatives, publication of stakeholders’ formal comments that are not subject to confidentiality and Argus’ response to those comments will also take place.

The market

Argus Coal Daily publishes price assessments for Americas and international coal markets.

Physical coal markets can be prone to periods of illiquidity. The Argus Coal Daily methodology is underpinned by a daily or weekly survey of market participants and was designed to incorporate market liquidity when it is present and to still provide robust price assessments even when it is not. Assessment-relevant trades are published on the Argus Direct platform and are available to subscribers.

Assessments are based on a two-part process: a volume-weighted average of deals done and on a survey of active market participants. In the absence of transactions, the assessment will be based on the market survey and the best bids and offers received. In the absence of both transactions and best bids and offers, the assessment will be based on the market survey.

To merit inclusion in the Argus assessment process, transactions and survey responses must meet standard specification guidelines.

All prices are assessed in US dollars per short ton or US dollars per metric tonne (tonne). Spark and dark spreads are assessed in US dollars per megawatt hour.

Market survey

For all assessments, Argus surveys a wide cross section of coal market participants via telephone, e-mail, instant messenger and other means of communication.

For weekly physical market price assessments, Argus maintains a balance between sellers of physical coal, utility buyers and trading companies. For daily over-the-counter market transactions and market data, Argus solicits information and transaction confirmations from brokerages and relevant market exchanges.

Transactions

Deals conducted on electronic trading platforms and through brokerage houses are included, provided they meet all relevant criteria for physical coal.

Deals with exchange of futures for physical (EFP) are included in assessments provided a fixed physical price is agreed before the trade is broken into its two parts.

Assessment timing

Assessments in Argus Coal Daily typically cover coal for loading or delivery sometime within the following 3 years, commencing as soon as the following month. Argus uses the Coal Trading Committee of the American Coal Council trading calendar for determining the spot month and spot quarter for daily over-the-counter coal assessments. For weekly physical market prices, a calendar quarter and year are used.
For forward trading in over-the-counter coal, each new month becomes “prompt” or “spot” after the 25th of the preceding month, or the final business day prior to the 25th. The prior prompt month settles as the average of the daily assessments of the trading month.

Prices are assessed for contracts traded for two nearby months, three calendar quarters (for instance 2nd quarter includes April, May, June), and the next three years ahead. Quarterly contract prices are assessed for a given calendar quarter up until the last trading day of the prior quarter, rolling on the 25th or the business day prior. Prices are also assessed for calendar years. The calendar year assessed will roll to the next year on 26 December, after the last assessment of a given year on the final trading day of that year, 24 December.

Monthly averages of daily assessments for spot month and spot quarter coal trading are published each month. The indexes will be published in the table “Argus OTC monthly settlement indexes” in Argus Coal Daily.

Weekly physical market assessments roll on the final business day of the calendar month and Argus publishes monthly and quarterly average prices for these assessments in Argus Coal Daily and Argus Coal Daily: Weekly Price Bulletin.

US over-the-counter market prices are assessed and published daily. Atlantic basin market prices are assessed weekly and published daily. Argus accepts all relevant market data up until the 4:00pm ET timestamp. Weekly coal prices typically are assessed on Fridays, unless Friday is not considered a full work day by Argus. These assessments represent the price at which transactions were done or would have been done during the trading week.

Weekly coal price assessments are republished each day in Argus Coal Daily until their next weekly assessment.

Seaborne cargo loading window
Seaborne price assessments typically cover coal for delivery or loading during the first and second calendar months forward.

Two-month assessments
The two-month delivery or loading period rolls forward on the first publication day following the last publication day of the last week of the month.

For example, during July 2015, these two-month assessments would be for coal delivered or loaded in August and September 2015. In this example, the delivery or loading period would roll to September and October 2015 on Monday, 3 August, the first publication day after the last publication day of the last week of July.

In those months where the last publication day of the month is not a Friday, the delivery or loading period will roll forward sooner.

For example, during November 2015, these assessments would be for coal delivered or loaded in December 2015 and January 2016. In this example, the delivery or loading period would roll to January and February 2016 on Monday, 30 November, the first publication day after the last publication day of the last full week of November.

**Shipping costs**

Argus Coal Daily shows freight rates for main trading routes for Capesize and Panamax vessels from Americas coal hubs. All are priced in US dollars/metric tonne.

**Freight rates**

These freight rates are assessed as a result of communications with leading shipping brokers and international traders of coal (see the Argus Freight methodology).

**Generating costs**

**Spark spreads**

Argus Coal Daily shows spark spreads or the difference between power prices and raw energy prices for the North American peak and off-peak power.

The implied spark spreads indicate the profitability of running a power plant taking into account variable fuel costs in the day-ahead, prompt-month and prompt-season markets. Argus spark spreads are based on Argus power, gas and coal assessments (see Argus US Electricity and Argus Natural Gas Americas methodologies).

Coal plant spark spreads are based on plants with an efficiency (heat) rate of 10,000 Btu/kWh, while gas spark spreads are based on 8,000 Btu/kWh. All prices are listed in US dollars/megawatt hour ($/MWh).

Coal prices used in the spark spread calculation are delivered prices to the specified power market region. The fuel costs are based on the percentage of types of coals taken by utilities in the given region. Transport costs are based on actual or anticipated costs of moving coal by rail or barge from the mine to the utility plant. Rates for those delivery routes are updated monthly (see Argus Coal Transportation methodology).

Argus assesses a bid-ask range for the US east coast fob Hampton Roads 6,000 kcal/kg specification. In times of illiquidity, the bid will be the lower of the netback from Argus’ cif ARA coal price assessment and the netforward from the Argus CSX 12,000 Btu/lb coal price assessment, adjusted for energy content, and the offer will be the higher of the two.

• Netback: weekly average Argus cif ARA (Amsterdam-Rotterdam-Antwerp) daily index less the Argus Capesize freight, ARA - US East Coast
• Netforward: the Argus price assessment of CSX 12,000 Btu/lb coal plus the Argus assessment of CSX-USEC freight. An energy content differential is subtracted from that value, which is then converted to metric tons from short tons.
  • Net forward component (CSX 12,000 Btu/lb coal plus CSX-USEC freight)
  • Energy content differential component ((CSX 12,500 Btu/lb coal minus CSX 12,000 Btu/lb coal)  \* 1.4)
  • Short ton to metric tonne conversion factor 1.10231

**US Gulf coast high-sulphur discount**

The difference between the weekly petroleum coke fob USGC assessments for 6.5% sulphur 40 HGI and 4.5% sulphur 40 HGI, converted to $/lb SO2/mmBtu.

Calculated on Friday, or the previous working day if Friday is a holiday, using the most recent inputs available at the time.

For more information see the Energy Argus Petroleum Coke methodology.

**Monthly OTC settlement indexes**

Argus publishes monthly indexes of over-the-counter coal assessments for uses including settlement of the 12,000 Btu CSX physical contract. These indexes use the Coal Trading Committee of the American Coal Council trading calendar to define the spot, or first forward, trading month. The spot month trades until the 25th of the month prior to its delivery, or the preceding business day. For example, the February contract is the prompt for settlement index purposes from 26 December to 25 January; from 26 January, March becomes the prompt month.

The indexes are the mathematical average of the spot month’s and spot quarter’s assessments during the index month.
